

SOLANA / COP

Ourcop.

A new dimension for digital assets.

A wallet experience in development. A token identity taking shape. A transparent starting point on Solana.

LAUNCHING SOON

COP has not been minted yet. No token address, active pool, launch price or launch date is published in this document.

1 BILLION

Planned total COP supply

95%

Meteora liquidity allocation

5%

Development reserves

Version 0.1 describes the project owner's pre-launch plan and the current demonstration website. It distinguishes proposed token and liquidity arrangements from features that are implemented today.

01 / WHY OURCOP

A clearer starting point.

Ourcop aims to make digital assets easier to understand, explore and manage through a coherent experience.

The product vision

The project brings a wallet interface, an asset overview, a proposed swap experience and COP information together. The design emphasizes clear controls, recognizable token artwork, accessible interactions, and transparent information about what is available.

Available today: an interactive demonstration

The website includes demo-wallet onboarding, illustrative holdings, balance visibility, activity and settings views, a swap preview, a development roadmap, project documentation, and community entry points. Light, dark and system themes, motion controls and responsive layouts support different viewing preferences.

What the demo does

A demo wallet creates a local DEMO identifier and stores preferences in the browser. Balances are illustrations. The experience lets visitors explore the interface without creating a blockchain account, requesting a recovery phrase, holding funds, signing a transaction, or executing a trade.

What remains in development

Production wallet connections, on-chain balances, custody and recovery design, executable swaps and related security testing remain future implementation work. A COP token launch does not by itself activate a production wallet or guarantee a delivery date for these features.

COP represents the Ourcop token identity. Specific economic utility, voting rights, staking rewards, revenue sharing, redemption rights or ownership claims have not been defined or promised in this version.

02 / COP TOKEN DESIGN

One billion. Two purposes.

The following figures are the project owner's planned launch allocation, not a report of on-chain issuance.

Coin name	Ourcop
Ticker / network	COP / Solana
Planned pair	COP/SOL
Planned total supply	1,000,000,000 COP
Launch status	Launching soon - not minted yet

95% / 950,000,000 COP

Allocated to the planned Meteora liquidity pool for the COP/SOL pair.

5% / 50,000,000 COP

Reserved for future development of the Ourcop project and experience.

The allocation totals 100% of the planned supply. Circulating supply, token program, decimals, mint and freeze authority settings, reserve custody, vesting terms, and reserve spending controls have not been finalized in this document. No lock, burn, renunciation or immutable-supply claim is made.

03 / LIQUIDITY AND DISCOVERY

Built around COP/SOL.

Meteora is the intended liquidity venue for the planned COP/SOL market.

The liquidity plan

The owner intends to allocate 950 million COP to a Meteora liquidity pool. Because COP has not been minted, the official mint and pool address are not available. The pool type, configuration, quote-side SOL amount, initial price and launch valuation remain unspecified.

What 95% means

The percentage describes the share of the planned COP token supply allocated to liquidity. It does not describe the proportion of the pool's value, an amount of SOL funding, a guaranteed liquidity depth, or a promise that liquidity is locked permanently. LP ownership, withdrawal controls and any lock terms must be disclosed separately.

Price information on the website

Before minting and launch, the homepage displays a pre-launch state instead of an invented market price. A read-only price connection is prepared for after launch. It checks the exact official Solana mint and Meteora pool, presents a data source and check time, and labels retained values as stale if updates fail.

External market access

The token section includes entries for DEX Screener, GMGN, Axiom, Birdeye and DEXTools. Verified COP links will be added after the official market exists. These entries do not imply a listing, partnership, endorsement, or current trading availability. Visitors initiate any activity on the external platform themselves.

Technical reference: [DEX Screener API documentation](#). Market data is informational and may be delayed or unavailable.

04 / FROM PREVIEW TO LAUNCH

Progress in clear stages.

The token launch and the production wallet have separate readiness requirements. No calendar date is committed.

01**FOUNDATION**

Implemented in the local website

Original branding, responsive pages, wallet demonstration, swap preview, settings, roadmap and token information.

02**TOKEN PREPARATION**

Current stage - launching soon

Finalize mint parameters, create the official COP token, publish the mint and authority information, and disclose reserve custody and control details.

03**LIQUIDITY AND DISCOVERY**

Planned

Configure the Meteora COP/SOL pool, disclose its address and liquidity terms, verify market data, and publish official market and community links.

04**PRODUCTION EXPERIENCE**

Future development

Complete wallet architecture, integrations, on-chain data handling, recovery and security work. Add real swapping only after review, testing and explicit release decisions.

05 / INFORMATION AND RESPONSIBILITY

Know what is confirmed.

A useful project document should make its limits as clear as its plans.

Confirmed project plan

The coin name is Ourcop, ticker COP, on Solana. The intended pair is COP/SOL. Planned supply is one billion COP, allocated 95% to Meteora liquidity and 5% to future development reserves. The owner has confirmed that the token has not been minted and is launching soon.

Information to publish before launch

The official mint and pool addresses; token program and decimals; mint and freeze authorities; circulating supply; reserve custody and vesting; liquidity control and lock terms; official social handles; and a launch announcement. These values must come from the project and be verified, rather than inferred from a matching ticker.

Risk and availability

Digital assets can be volatile and lose value. Liquidity may be insufficient, prices may differ across venues, and on-chain transactions may be irreversible. Smart-contract, wallet, custody, market-data and third-party platform failures are possible. No financial return, liquidity guarantee, audit completion or regulatory approval is claimed.

Document status

This pre-launch draft was prepared from the project owner's instructions on 12 October 2026. It is a project description, not an offer, investment recommendation, or promise of returns. Features and unresolved launch terms may change. The project should update this document when the official mint, pool and operational details are finalized.

Official project materials: the Ourcop website's Token, Roadmap, Docs and Community pages. Social handles and support details remain unpublished in this build. External reference: docs.dexscreener.com/api/reference.
